

Unit - II  
Alcohols, phenol, and Ethers.

Introduction.

# Classification :

[a] Alcohol and phenols

→ They are classified as, Mono, Di, Tri or polyhydric

~~Mono~~ Monohydric

Dihydric

Trihydric

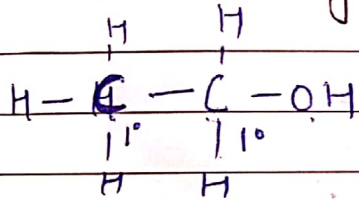

→ Monohydric alcohol further classified to hybridisation of Carbon atom to which hydroxy group is attached.

(i) Compound containing  $sp^3 - OH$  bond.

→  $-OH$  group is attached to  $sp^3$  hybridised Carbon.

→ They are further classified as.

[a] Primary, Secondary and Tertiary alcohol.

primary ( $1^\circ$ )

Secondary ( $2^\circ$ )

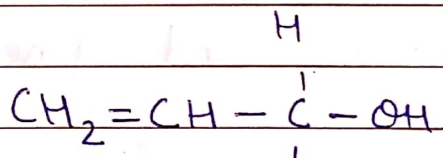

Tertiary ( $3^\circ$ )

[b] Allylic alcohol.

primary

Secondary

Tertiary.

[c] Benzylic alcohol.

1°

2°

3°

[ii] Compound containing  $C_{sp^2} - OH$  bond:

[B] Ethers

→ They are classified as Simple/Symmetrical and Mixed/Unsymmetrical.

## # Structure of functional group.

Methanol.

phenol.

→ Methoxy methane.  
(ether)

Q. The bond angle in alcohol is slightly less than tetrahedral angle ( $109^\circ - 28'$ ). why?

Ans Due to the repulsion b/w the unshared pairs of electron of oxygen.

Q. Carbon-oxygen bond length in phenol is less than that in methanol. why?

Ans (i) due to partial double bond character  
(ii)  $sp^2$  hybridised state of carbon to which oxygen is attached. [50% s-character]

Q. The bond angle in Methoxymethane [ether] is slightly greater than tetrahedral angle. why?

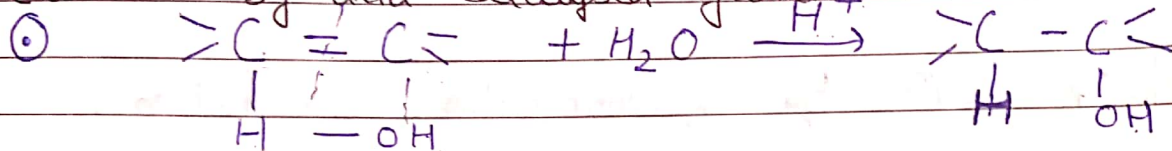

Ans due to bulky alkyl groups.

# # Alcohols and phenols.

## ⊙ Preparation of Alcohols.

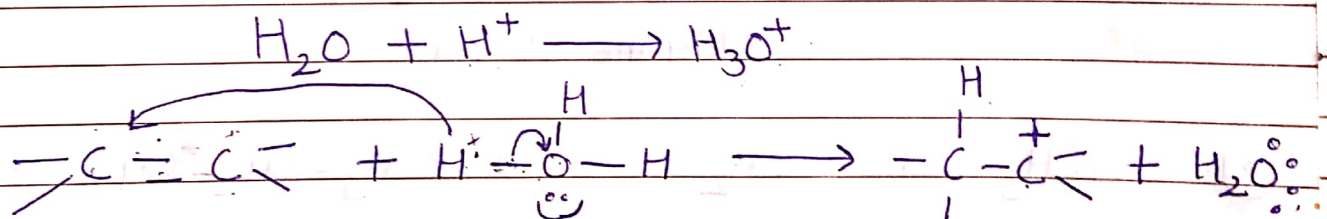

1. from alkenes

[i) By acid Catalysed hydration.

→ Mechanism

STEP-1 Protonation of alkene to form Carbocation by electrophilic attack of  $H_3O^+$ .

STEP-2: Nucleophilic attack of water on Carbocation.

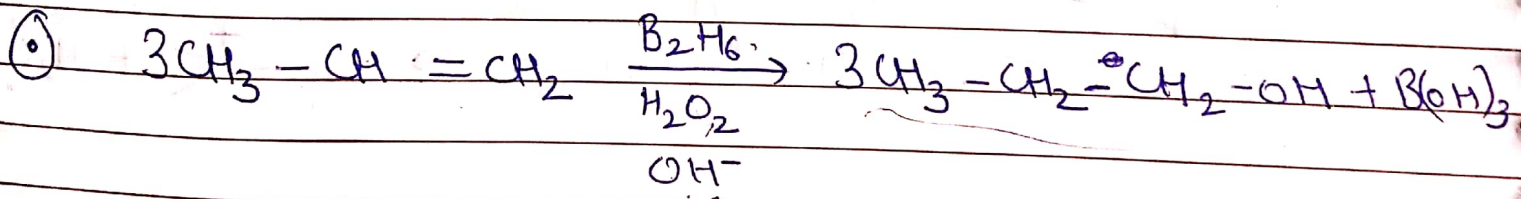

STEP-3 Deprotonation to form an alcohol.

(ii) Form  $\text{C}_3\text{H}_7\text{OH}$  By hydroboration Oxidation.

Propane-1-ol.

## 2. from Carbonyl Compounds.

[i] Reduction of aldehyde and ketone.

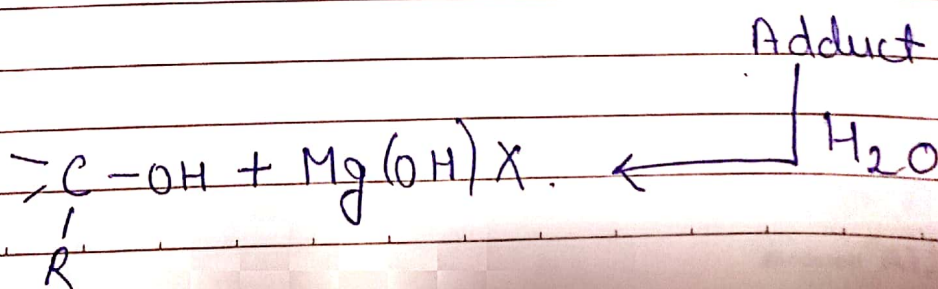

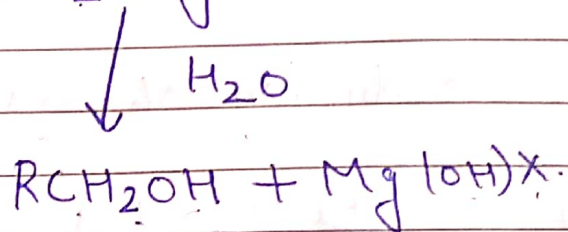

**NOTE** Aldehyde  $\longrightarrow$  primary alcohols  
Ketone  $\longrightarrow$  Secondary alcohols

[ii] By reduction of Carboxylic acid and ester.

## 3. From Grignard reagent.

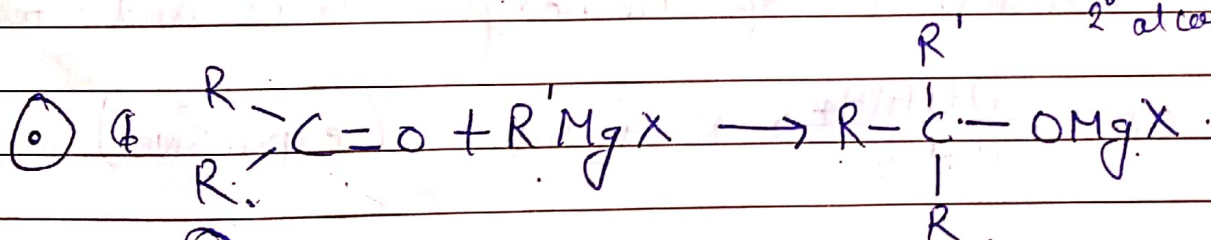

1° alcohol.

↓ H<sub>2</sub>O

2° alcohol.

↓ H<sub>2</sub>O

**NOTE**

Methanal

→

primary alcohol.

aldehyde

→

Secondary alcohol.

Ketone

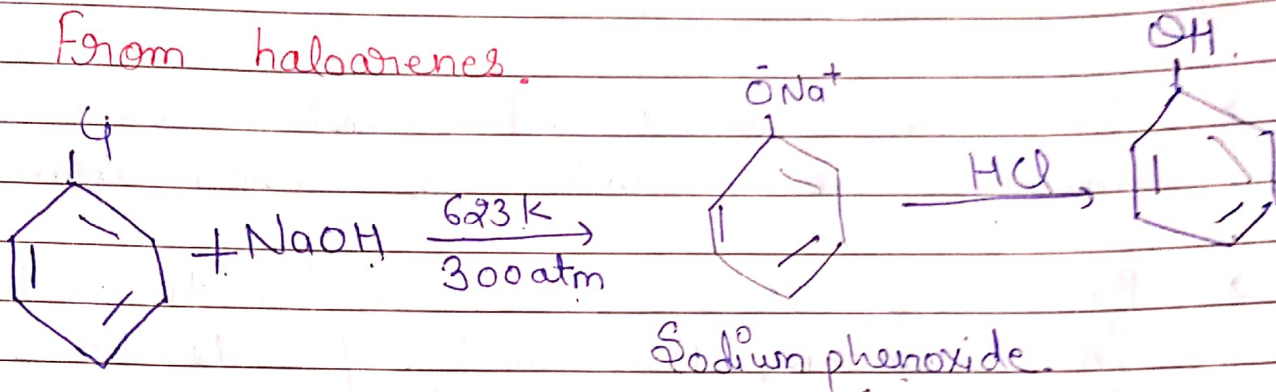

→

tertiary alcohol.

# # Preparation of phenol.

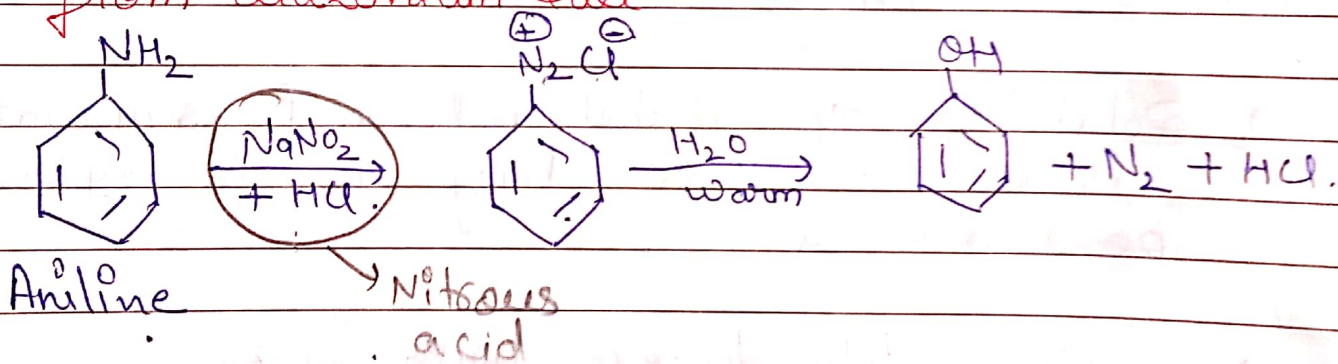

## 1. From haloarenes.

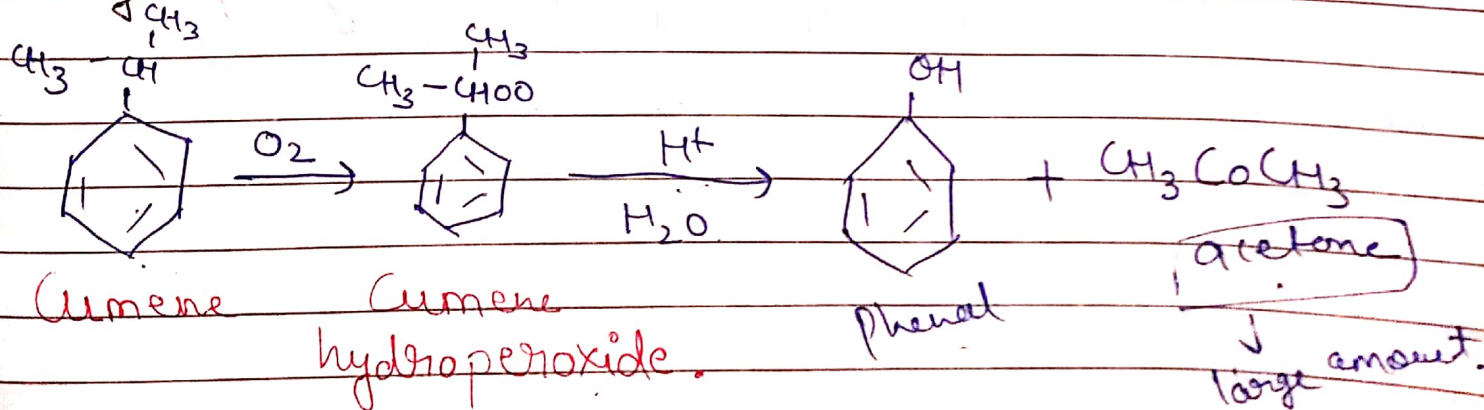

## 2. From benzenesulphonic acid.

## 3. From diazonium salt

## 4. From Cumene.

#

## Physical properties.

### ① Boiling point.

→ B.P of alcohols and phenol increase with increase in number of carbon atoms.

→ B.P of alcohols decrease with increasing in branching. As Vander Waals force decrease with decrease in surface area.

**Note:** B.P of alcohols and phenol higher in comparison to other class of compound (Hydrocarbon), due to the presence of intermolecular hydrogen bonding.

### ① Solubility.

→ Solubility of alcohol and phenol in water is due to their ability to form hydrogen bond with water.

→ Solubility decrease with increase in size of alkyl/aryl (hydrophobic) group.

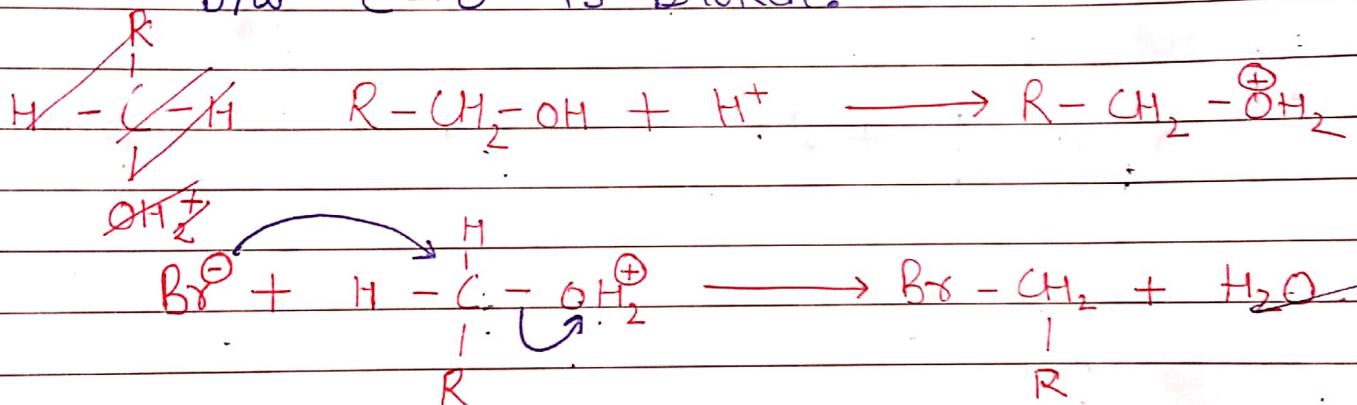

# # CHEMICAL REACTIONS.

- Alcohols are versatile compounds. They react as nucleophiles as well as electrophiles.

NOTE: when alcohol react with as nucleophiles bond b/w O-H is broken.

- (ii) when alcohol react as electrophiles. bond b/w C-O is broken.

[a] Reaction involving cleavage of O-H bond.

## 1. Acidity of alcohols and phenols.

→ Alcohol and phenol react with Metal Such as Sodium, potassium and aluminium to yield alkoxide/phenoxide.

tert-Butyl alcohol.

Aluminium tert-butoxide

Sodium phenoxide

→ The above reaction show that alcohol and phenol are acidic in nature.

### (iii) Acidity of phenols:

○ Hydroxy group is directly attached to  $sp^2$  hybridised carbon of benzene ring and act as  $e^-$  withdrawing group.

→ Due to charge distribution and its resonance structure cause oxygen of OH group to be positive.

The  $R^H$  of phenol with aq. NaOH indicate that phenol are strong acid than alcohol and water.

○ Ionisation of an alcohol and phenol take place as follow:

Due to higher electronegativity of  $sp^2$  hybridised carbon of phenol to which -OH is attached, electron density decr. on oxygen and incr. the polarity of O-H bond and increase ionisation in phenol that of

→ alcohol.

→ The presence of  $e^-$  withdrawing group such as Nitro group increase the acidic strength of phenol. This effect is more pronounced when such a group is present at Ortho and para positions.

(1,2)

(1,4)

→ Presence of  $e^-$  donating group such as alkyl group decrease the acidic strength of phenol.

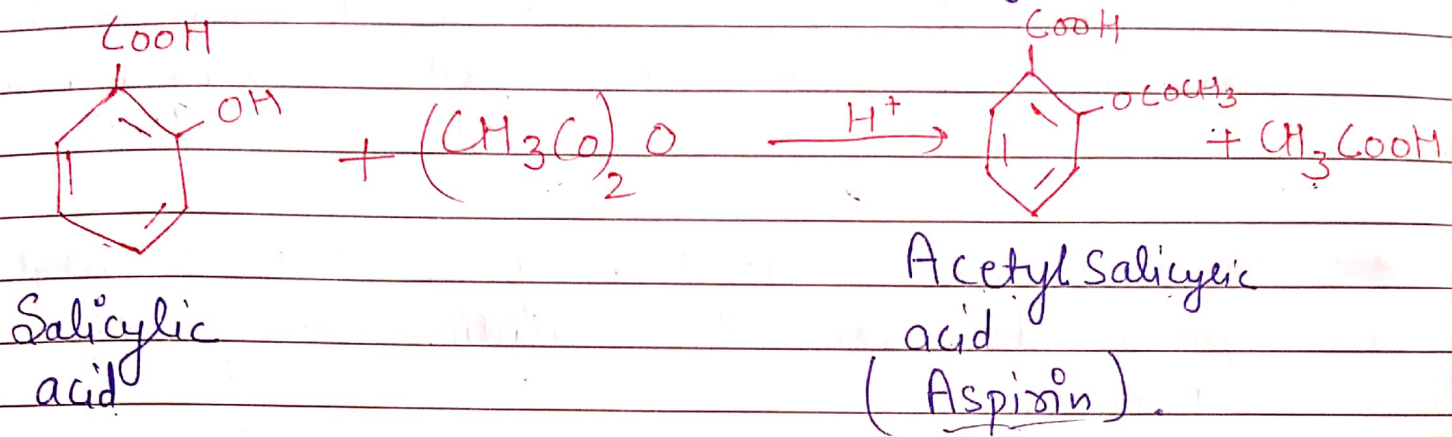

## # Esterification.

Alcohol and phenol react with Carboxylic acid, acid chloride and acid anhydrides to form ester.

## ① Acetylation of Salicylic acid.

→ Introduction of acetyl ( $\text{CH}_3\text{CO}$ ) group in alcohol and phenol is known as acetylation.

[b] Reaction involving cleavage of C-O bond in alcohols.

[i] Reaction with hydrogen halides:

→ Reactivity of three class of alcohol with HCl distinguishes from Lucas test

Lucas Reagent (Conc. HCl and  $\text{ZnCl}_2$ )

- $3^\circ$  alcohol → turbidity produce immediately
- $2^\circ$  alcohol → Take some time.
- $1^\circ$  alcohol → do not produce turbidity.

STEP 2: Formation of Carbocation: It is Slowest Step and hence, the rate determining Step of Reaction.

STEP 3: Formation of ethene by elimination of a proton.

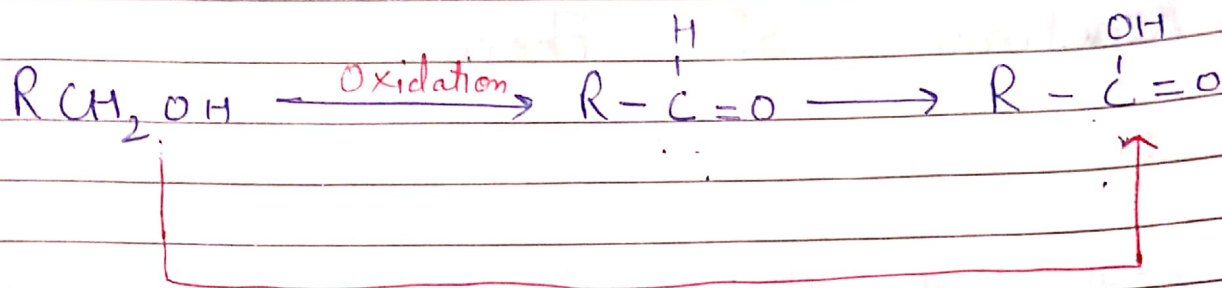

① The acid used in Step 1 released & in Step 3.

② Oxidation: involve the formation of Carbon Oxygen double bond with cleavage of an O-H and C-H bond.

also known as dehydrogenation reaction as loss of dihydrogen from an alcohol.

acidic KMnO<sub>4</sub>

Pyridinium chlorochromate

**NOTE:** 3° Alcohol do not Undergo Oxidation.

④ When Vapour of 1° or a 2° alcohol are passed over heated Cu at 573K. then.

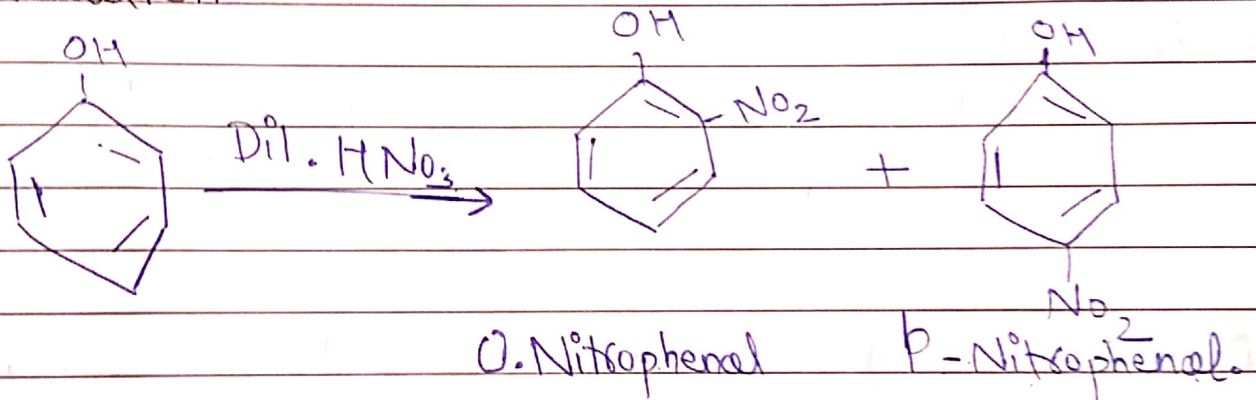

# # Reactions of Phenols

## 1. Electrophilic aromatic Substitution.

- The -OH group attached to benzene ring activates it toward electrophilic Substitution.
- Also it direct the incoming group to ortho and para position in ring as these position become electric rich due to resonance effect caused by -OH group

### [i] Nitration

→ o-Nitrophenol is steam volatile due to intramolecular hydrogen bonding.

→ p-nitrophenol is less volatile due to intermolecular hydrogen bonding which cause the association of molecule

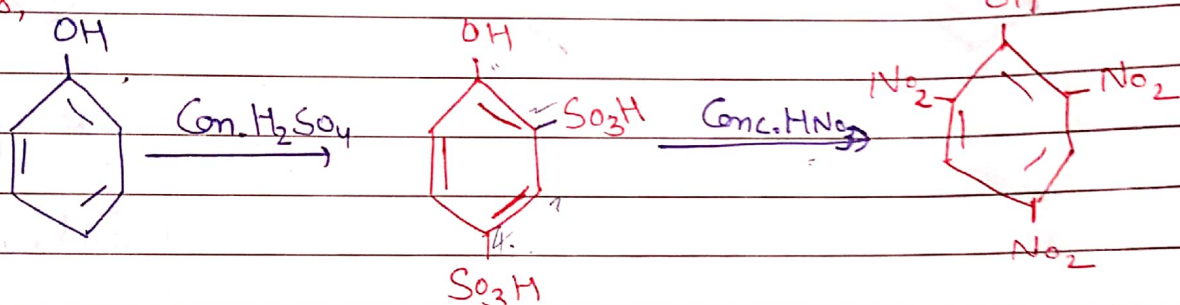

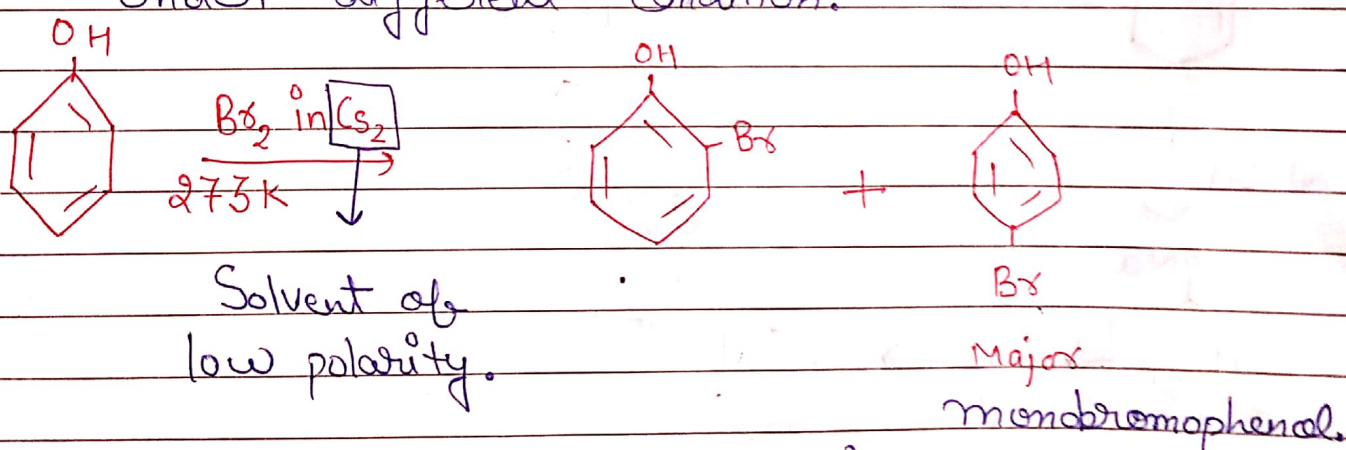

2,4,6-Trinitrophenol.  
(picric acid)

The yield of reaction product is poor.

New days,

(ii) Halogenations: Treating phenol with bromine different product are formed under different condition.

⊙ Halogenation of benzene take place in presence of Lewis acid such as  $\text{FeBr}_3$ , which polarise halogen molecule. In case of phenol polarisation of bromine molecule take place in absence of Lewis acid. due to highly activating effect of  $-\text{OH}$  group.

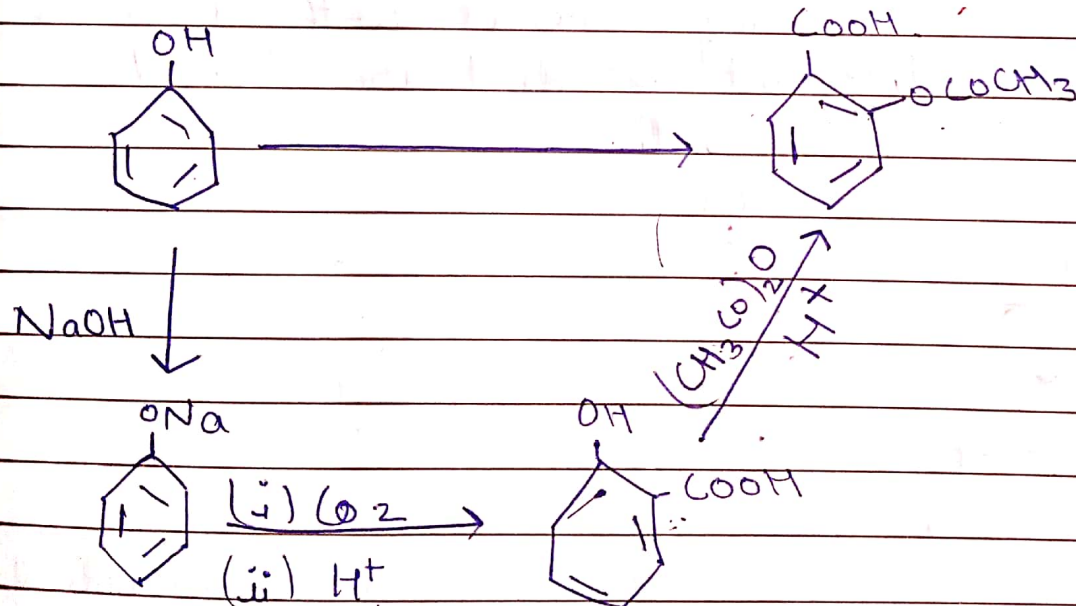

2. Kolbe's reaction

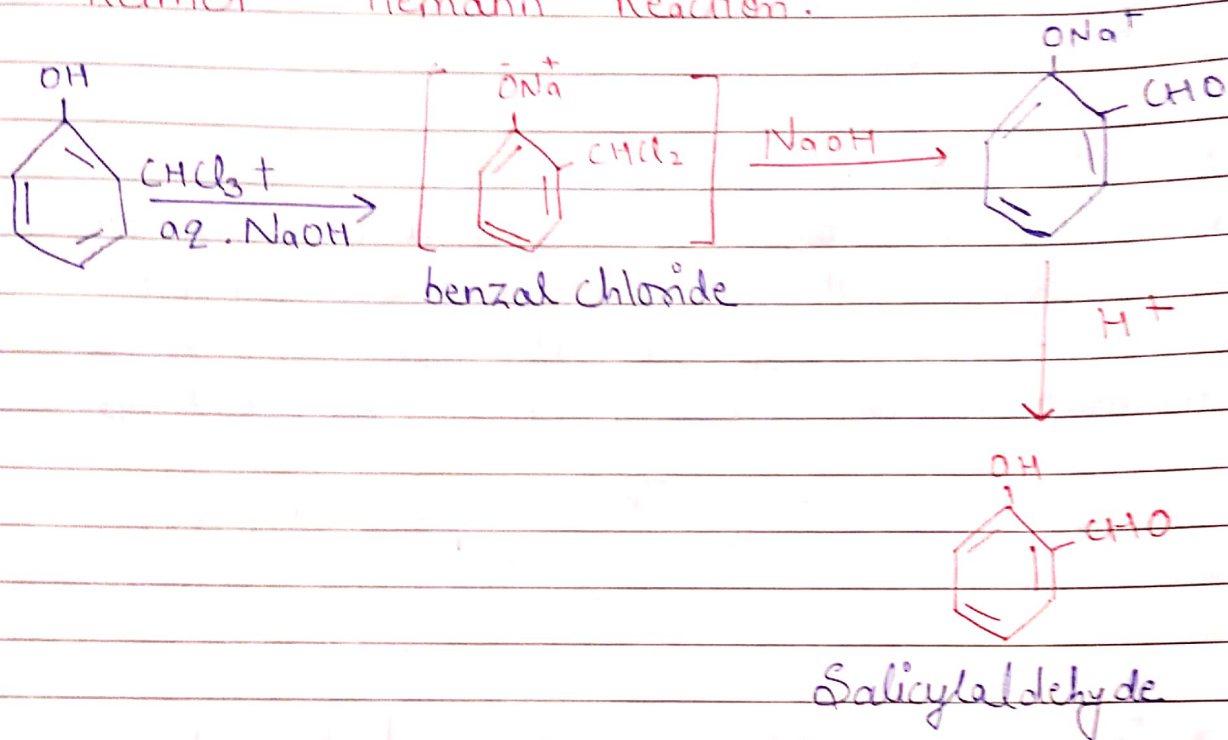

2-Hydroxybenzoic acid

(Salicylic acid)

Q. Convert phenol into Aspirin.

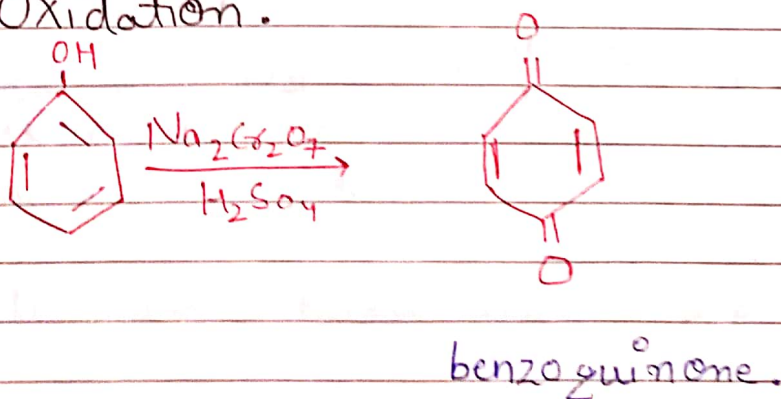

### 3. Reimer - Tiemann Reaction.

### 4. Reaction of phenol with Zinc dust.

### 5. Oxidation.

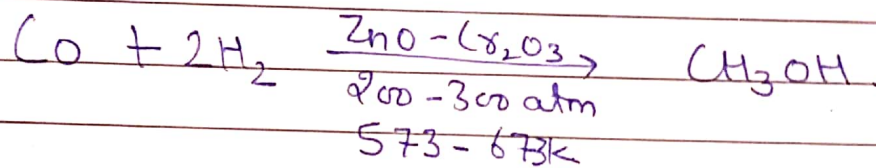

# # COMMERCIALLY IMPORTANT ALCOHOLS.

## 1. Methanol.

→ Formula =  $\text{CH}_3\text{OH}$

→ produce by destructive distillation of wood.

Today, Methanol is produce by Catalytic hydrogenation of  $\text{CO}$  at high pressure and temperature in presence  $\text{ZnO}-\text{Cr}_2\text{O}_3$  catalyst

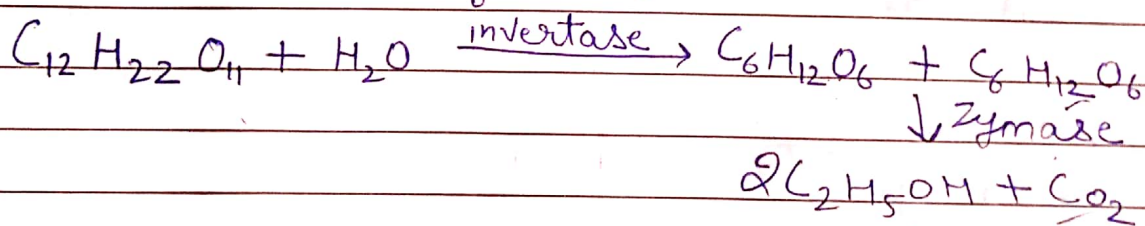

→ It is a Colourless liquid and boil at  $337 \text{ K}$ .

→ poisonous in nature

→ Used as Solvent in paints, Varnishes and for making Formaldehyde.

## 2. Ethanol. [ $\text{C}_2\text{H}_5\text{OH}$ ]

→ Commercially produce by Fermentation of Sugar.

→ Action of Zymase inhibit once the % of alcohol exceed  $14\%$ .

→ It is a Colourless and boil at  $351 \text{ K}$ . Used as Solvent in paint industry. Commercially alcohol made Unfit for drinking by adding  $\text{CuSO}_4$  and pyridine. It is known as **denaturation of alcohol.**

#

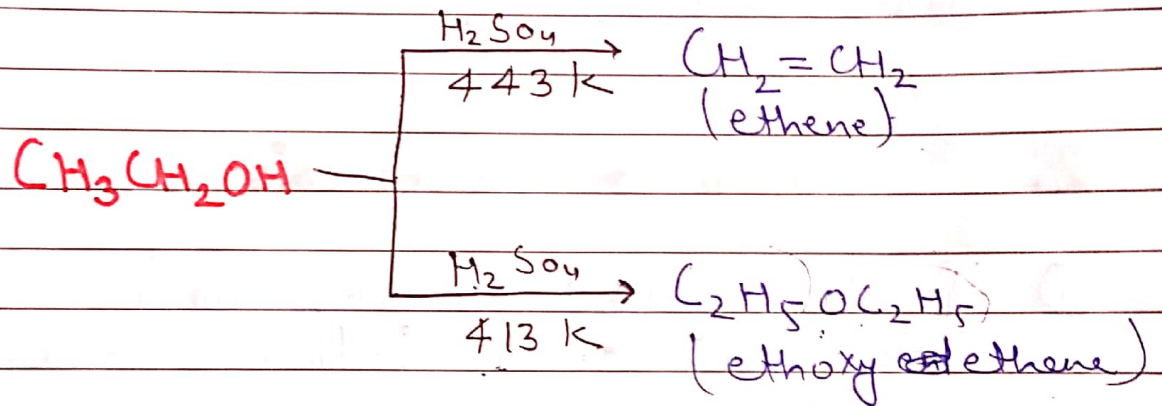

# ETHERS

#

## Preparation of ether.

1. by dehydration of alcohol.

→ Alcohol undergoes dehydration in presence of protic acid ( $H_2SO_4$ ,  $H_3PO_4$ ). Reaction product depend on reaction condition.

○ Formation of ether is ( $S_N2$ ) reaction involving the attack of alcohol on a protonated alcohol.

- ① The method is suitable for preparation of ethers having primary alkyl groups only.
- ② The reaction follows  $S_N1$  pathway when the alcohol is  $2^\circ$  or  $3^\circ$ .
- ③ Dehydration of secondary and tertiary alcohols to give ethers is unsuccessful and alkenes are easily formed.

## 2. Williamson Synthesis

- ① In this method an alkyl halide is allowed to react with sodium alkoxide.

- ② Ethers containing substituted alkyl group ( $3^\circ$  or  $2^\circ$ ) also prepared by this method.

- ③ Better results are obtained if alkyl halide is primary. In case of  $2^\circ$  or  $3^\circ$  alkyl halide elimination competes over substitution.

→ It is because alkoxide are also strong base as well. They react with alkyl halide leading to elimination  $\text{R}^n$ .

① Phenol are also converted into ether.

## # Physical properties

① B.P of ethers are comparable of alkene having comparable molecular mass. but less than that of alcohol.

② The miscibility of ether with water resembles those of alcohol of same molecular mass. due to the presence of oxygen in ether which can also form hydrogen bonding with water.

# # CHEMICAL REACTION.

## 1. Cleavage of C-O bond in ethers.

Reaction of dialkyl ether give two molecules alkyl halide when react with excess of hydrogen halide.

③ order of reactivity of hydrogen halide.

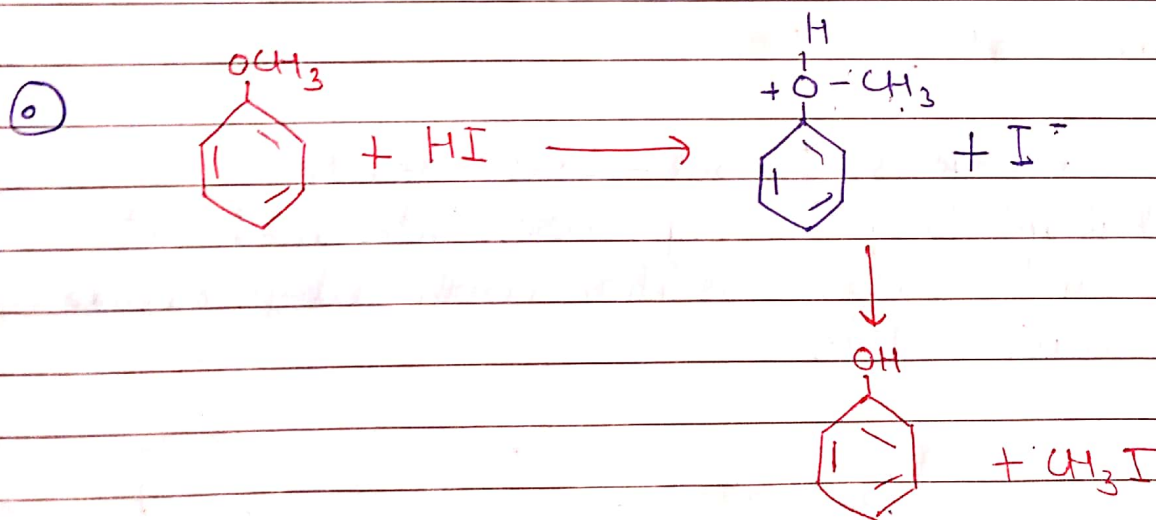

→ Cleavage of ether take place with Conc. HI or HBr at high temperature.

④ Mechanism

Mechanism.

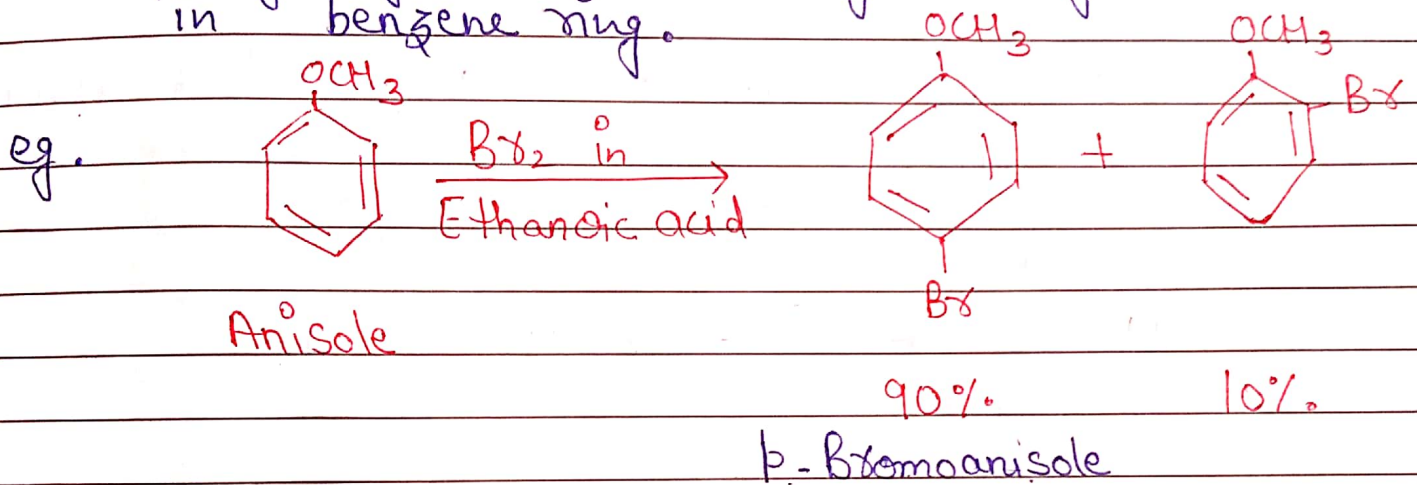

→ The bond b/w O-CH<sub>3</sub> is weaker than the bond b/w O-C<sub>6</sub>H<sub>5</sub> because carbon of phenyl group is sp<sup>2</sup> hybridised and there is a partial double bond character.

## 2. Electrophilic Substitution.

(i) The alkoxy group (-OR) is Ortho and para directing.

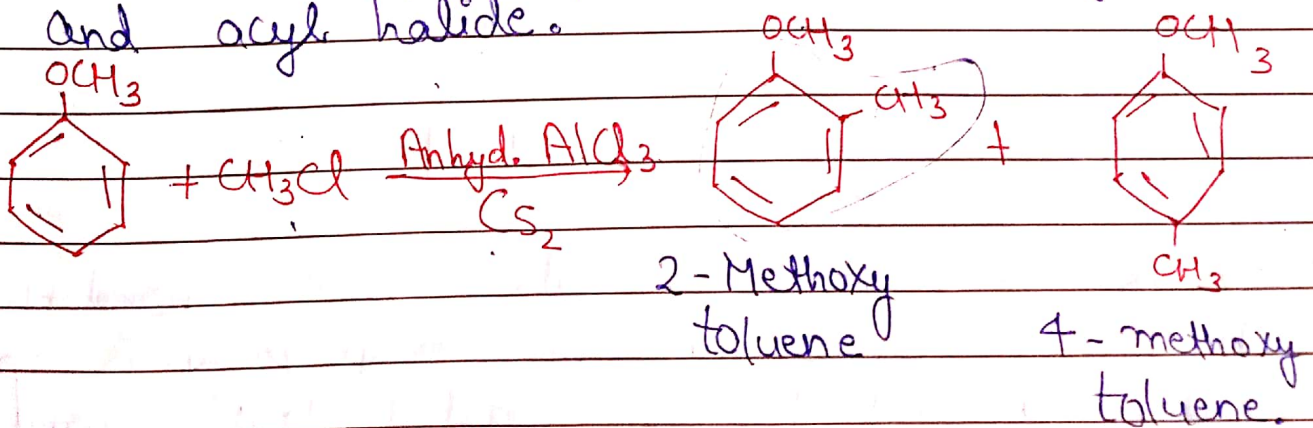

### (i) Halogenation :

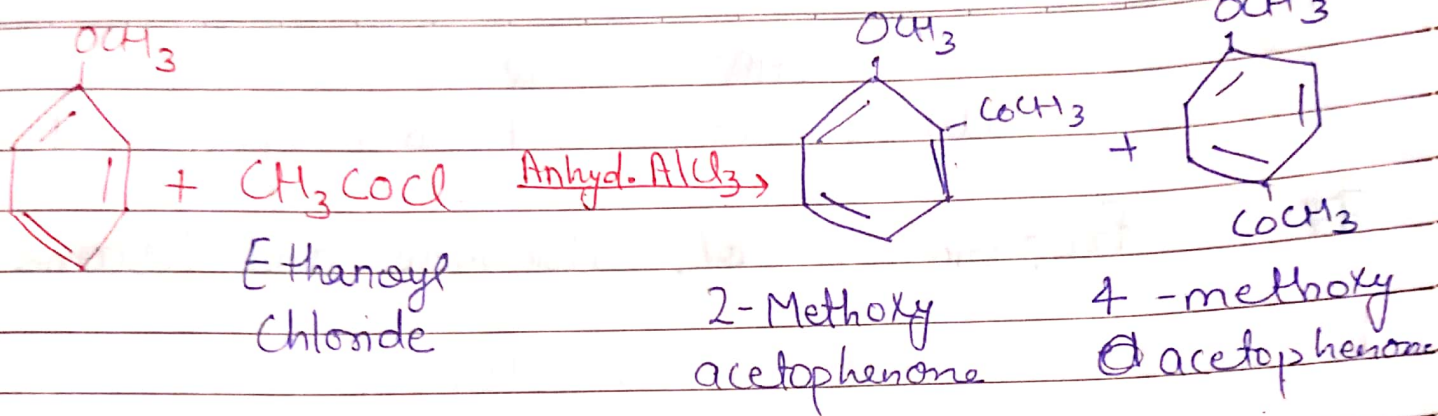

(i) Phenylalkyl ethers undergo halogenation in benzene ring.

### (ii) Friedel-Craft reaction :

(i) Anisole undergoes Friedel-Craft reaction i.e. alkyl and acyl group are introduced at Ortho and para position with alkyl halide and acyl halide.

(iii) Nitration:
